

V6 Annotation Guidelines_EN_Version

All data requires annotation.

1. Main Task

1.1 Verify Action Descriptions (Label)

Determine if the action preannotation or descriptions in the video are correct. Approve if correct; modify if incorrect.

1.2 Verify Timestamps

Determine if the start and end timestamps for each pre-annotated time segment are correct. Approve if correct; modify if incorrect.

1.3 Verify Summary (Caption)

Determine if the summary of the video is correct. Approve if correct; modify if incorrect.

2. Standards for Correct Action Descriptions

2.1 Formula:

- An action description must consist of a **specific, unambiguous active verb + target object** OR a **physical body movement** (such as turn around, squat, kneel, sit down, stand up, move, etc.). The description must accurately match the actual action taking place in the video segment, **must not include a subject or any adverbs** modifying the verb (including these will be considered an error).
- Use the base form for all verbs.
- To maintain formatting consistency, all descriptions start with a capital letter and end with a period.

2.2 Single-Verb Restriction:

A single descriptive sentence **can contain only one verb**, with the following exceptions:

- Asymmetrical bimanual actions (left and right hands performing different independent actions simultaneously).
- Combined torso-hand actions (e.g., "turn around and [hand action]", "squat and [hand action]", "kneel and [hand action]", "sit down and [hand action]", "stand up and [hand action]").

2.3 Use precise verbs:

Avoid vague, broad, or non-descriptive expressions; instead, ensure the chosen verbs accurately reflect the specific actions in the video. Verbs refer to clear, observable manual behaviors. Broad verbs like "organize," "clean" or "adjust" should only be used if no specific, accurate verb exists. If a more precise verb is available, using a broad one is an error.

- **Move vs. Pick up/Put down:** If an object is moved less than 10cm above the surface, "Move" is sufficient. If it exceeds 10cm or changes surfaces or locations (e.g., from table to cabinet), use "Pick up" and "Put down" (or equivalent verbs). For movements ≤ 10 cm, using pick up + put down is acceptable but not recommended.

- **Mandatory Location Specification for Pick, Place and Move Actions:**

When placing an object down, **the destination location must be explicitly specified**; omitting it is an error.

When picking an object up, **the starting location must be explicitly specified**; omitting it is an error. (e.g., "pick up [object] from [location]").

Action Type	Incorrect Examples (X)	Correct Examples (✓)
Pick up	The person lifts the apple. (<i>Has subject, missing location</i>)	Lift the apple from the table.
Put down	Place the mug. (<i>Missing location</i>)	Place the mug on the tabletop.

- **Location Consistency for "Pick up" Actions:** All "pick up" type actions (including picking up, retrieving, gathering, taking) must include the starting location, and the **description for the exact same location must remain consistent**.

- **Scenario:** Multiple apples are resting on a table, but they also happen to be next to a banana and near a wall. A person picks up several apples sequentially.

- *Correct Example:* "Pick up an apple from the table", "Pick up an apple from the tablet", "Pick up an apple from the table".
- *Incorrect Example:* "Pick up an apple from the table", "Pick up an apple from next to the banana", "Pick up an apple from near the wall". (*Mixing reference frames for the exact same surface location is an error.*)
- Avoid vague terms like "designated position" or "somewhere."
- June 22rd update: When annotating actions involving **picking up** or **placing down** an object, the specified location (the source or destination) must be determined strictly by the object's **primary contact surface**. Do not default to generic background surfaces (such as "the table") if the item is actually resting on top of another object.

Example :

- **Scenario:** A mirror is resting flat on top of another mirror, which sits on a desk. The person lifts the top mirror.
- **✗ Incorrect:** Pick up the mirror from the table. (*Inaccurate: The table is not the primary contact surface.*)
- **✓ Correct:** Pick up the mirror from another mirror.
- Verbs that describe a **static holding state** (e.g., holding, gripping, supporting) should not be annotated, as they represent a **continuous state** rather than an action, and do not result in any observable change to the object.

2.4 Modifying Words:

Adjectives modifying nouns are acceptable if they are visually accurate and necessary to distinguish between similar objects. Though omitting them entirely is also correct and preferred.

- *Clarification Example:* In the sentence "**Slowly** pick up the book with a **red cover**, **forcefully** place the **round** object on the **wooden** table":

Adverbs (Modifying Actions): "Slowly", "Forcefully". (**STRICTLY PROHIBITED**)

Adjectives (Modifying Nouns): "Red cover", "Round", "Wooden". (**ALLOWED** if accurate, but omitting them is highly recommended).

2.5 Simultaneous Actions

- Actions occurring at the **exact same time must be merged into a single time segment**; splitting them into separate segments is an error (e.g., "turn and [action]", "move and [action]", "stand up and [action]")
- **Primary vs. Auxiliary Actions:** If multiple actions are performed on a single target object simultaneously, there is typically one primary action and others that are auxiliary. Therefore, we only need to describe the primary action. For example, if someone is wiping a plate while rotating it, 'rotating' is the auxiliary action and 'wiping' is the primary action, so we only need to describe the wiping. The same logic applies to 'wiping a phone,' where 'wiping' is the primary action and 'picking up the phone' is the

auxiliary action. If you encounter any exceptional cases, we can discuss further. Examples are as follows:

[\[8348b2d2-06d3-48d9-8468-44804b98bd70.mp4\]](#)

[\[cbd1125c-2a0e-40d0-836f-646d34fe3ed0.mp4\]](#)

- **Asymmetrical Bimanual Actions:** If both hands are performing different actions simultaneously, **must** specify what each hand is doing; otherwise, it is considered an error.

Updated on 7 July: When facing simultaneous two-hand actions, or called asymmetrical bimanual actions, the annotation should fully follow the structure below:

1. If the actions are "pick up" or "put down" actions, please follow: "Pick up ... from ... with the left hand, and pick up ... from ... with the right hand."

Please note the following:

- 1) The second clause (after "and") should also include a verb.
- 2) The sentence structure should follow Verb + (pickup location, if applicable) + "with" + the corresponding hand.

2. If the actions are not "pick up" or "put down" actions, please follow: "Move ... with the left hand, and move ... with the right hand."

Please note the following:

- 1) The second clause (after "and") should also include a verb.

In other scenarios, specifying "left hand," "right hand," or "both hands" is optional but must be factually correct. (e.g., If the action was performed by the left hand, writing "right hand" is an error. If performed by one hand, writing "both hands" is an error.)

- **May 27th Update:** If both hands perform the same **action** on the same **object** at the same **location**, do not need to specify the hands. However, if any of these three elements (action, object, or location) differ, they must be described separately.

Examples (Updated on 7 July):

- Pick up a tissue from the table with the left hand, and pick up tissue from the table with the right hand. → Can be merged as "pick up tissue from the table."
- Pick up a tissue from the table with the left hand, and place the tissue on the table with the right hand. → Cannot be merged.
- Pick up a tissue from the table with the left hand, and pick up a paper cup from the table with the right hand. → Cannot be merged.

- Pick up a tissue from the table with the left hand, and pick up a paper cup from the chair with the right hand. ➡ Cannot be merged.
- Pick up a tissue from the table with the left hand, and pick up a tissue from the chair with the right hand. ➡ Cannot be merged.
- If the same hand performs two actions in a short period of time, and the start times of the two actions are close to each other, they should not be treated as simultaneous actions and must be described separately.
- **Body Movement + Hand Action:** If a hand action is performed simultaneously during a body movement or posture change (such as moving, squatting, kneeling, standing up, sitting down, or turning around), both actions must be described together within the same timestamp segment.

Correct (✓): Move and wrap the phone cable.

Incorrect (✗): Move.

Incorrect (✗): Move then wrap the phone cable.

2.6 Splitting Actions

Overarching Principle: If an action is split very granularly, as long as the descriptions accurately match the video content and the timestamps contain no errors, the annotation is considered correct. However, over-splitting significantly reduces efficiency and is highly discouraged.

2.6.1 Hand Actions

Non-Interactive Hand Gestures (No Object Contact)

Gestures where the hand does not come into contact with any external object **must not be annotated**; annotating them is an error.

Example:

Hand Actions

Video

Reaching out, flipping hand [\[20260320140819.mp4\]](#)

**Do not
annotate**

Thumbs-up, reaching forward, hand dropping, flipping [\[20260320141003.mp4\]](#)

**Do not
annotate**

**Do not
annotate**

Left hand hovering in the air while the right hand performs actions

[\[20260320141250.mp4\]](#)

Interactive Hand Actions (With Object Contact)

For actions involving an interactive object, specifying the exact tool or secondary instrument used is optional. Both inclusions and omissions are correct.

Examples:

Wipe the table with a cloth — **Correct**

Wipe the table — **Correct**

Cut the cucumber with a knife — **Correct**

Cut the cucumber — **Correct**

Immediate Pick Up and Put Down

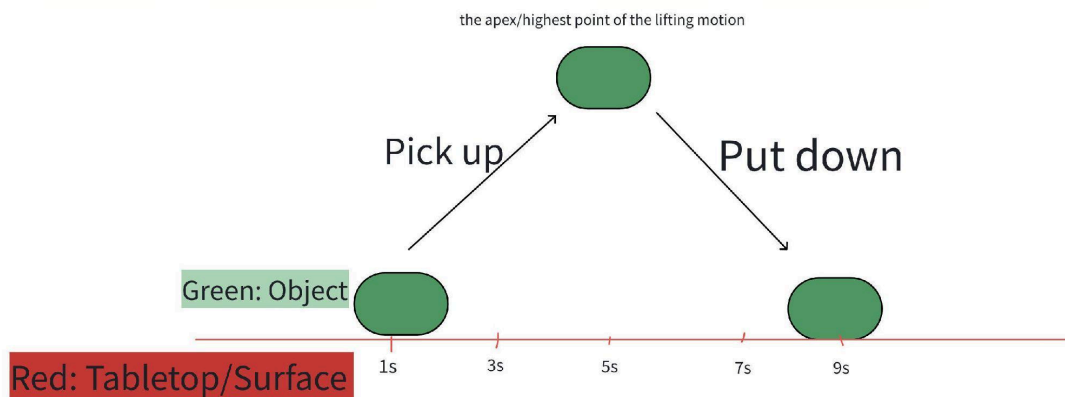

If an object is picked up and immediately put down, **must split the sequence into two distinct action segments**: "Pick up" and "Put down". The end timestamp of "Pick up" must perfectly match the start timestamp of "Put down"; any gap or overlap is an error. **It means there should be no gap between the "pick up" and "put down" segments.**

Since there are no other actions in between, these two segments must be perfectly seamless on the timeline. For instance, if "pick up" ends at **00:07.40**, then "put down" must start exactly at **00:07.40**. If there is any gap or overlap between them, the calculation will be flagged as incorrect.

The screenshot displays a video analysis interface. On the left, a video frame shows a person's hands in a bathroom, with one hand near a toilet and the other near a trash bin. On the right, a table lists the actions and their timestamps. The table has columns for '序号' (Serial Number), '时间' (Time), '属性' (Attribute), and '操作' (Action). The actions are: 1. '向马桶与垃圾桶的方向下蹲' (Squatting towards the toilet and trash bin) from 0:04.40 to 0:05.71; 2. '拾取地上的纸屑' (Picking up paper屑 from the floor) from 0:05.81 to 0:07.40; and 3. '将纸屑投入垃圾桶' (Putting paper屑 into the trash bin) from 0:07.40 to 0:08.40. The '时间' column for action 2 is highlighted with a red box, and the '时间' column for action 3 is highlighted with a green box. A green arrow points from the end of action 2 to the start of action 3, indicating a seamless transition. Below the table, a 'KeyPoints' section shows a timeline with a green box around the 0:07.40 mark, labeled '放下"动作开始的时间戳" "put down" starts at 00:07.40'. At the bottom, a video player shows a timeline from 00:00 to 00:11, with a red marker at 00:04.5 and a blue bar representing the video duration.

序号	时间	属性	操作
1	0:04.40 - 0:05.71		向马桶与垃圾桶的方向下蹲
2	0:05.81 - 0:07.40		拾取地上的纸屑
3	0:07.40 - 0:08.40		将纸屑投入垃圾桶

- *Optimal Cutoff:* For immediate pick-and-place sequences, the optimal split point for "Pick up" is at the apex/highest point of the lifting motion. However, any cutoff point within a reasonable transitional window is acceptable as long as they connect seamlessly.

Note: Annotating non-primary or incidental "pick up" and "put down" actions is optional. Furthermore, there is no rule stating that a "put down" action must always be preceded by a "pick up" action—as long as the individual segment description is accurate, it is correct.

Handling actions that follow picking up an object:

If an object is picked up and not put down immediately, but followed by other actions instead, the end timestamp of the "pick up" action can be captured at the moment the object leaves the surface. It does not need to align with the start timestamp of the subsequent "put down" action. As shown below, in the video, the milk powder is picked up but not put down immediately; instead, it is flipped and torn open. In this case, the end timestamp for the "pick up" action is the exact moment the milk powder bag completely leaves the counter.

[\[20260320151852.mp4\]](#)

Continuous or Repetitive Actions

Continuous, repetitive movements (such as peeling an eggshell, gathering papers from a table, or wiping a table with a cloth) can be merged into a single action segment if there are no noticeable pauses or intervening behaviors with a different purpose. If there is a distinct pause or an intervening behavior, the segment **must be split** at that point.

- *Noticeable Pause Definition:* A period of inactivity lasting approximately **1.5 seconds or more**.
- *Example:*

In this paper-gathering video, the process is divided into four segments: the initial 'flip papers,' 'flip papers,' 'pick up papers,' and the final 'align papers.'

[\[20260320155042.mp4\]](#)

- *Example:*

In this egg-peeling video, each distinct instance of tossing eggshells onto the tabletop must be segmented and described separately.

[\[20260320154732.mp4\]](#)

Hand-to-Hand Transfer

Annotating a hand-to-hand transfer is **mandatory only** if the transfer has a highly explicit intent or if the overall task cannot be completed without switching hands; omitting it in these cases is an error. In all other incidental or casual scenarios, annotating the transfer is optional (omitting it is correct, and annotating it with accurate timestamps and descriptions is also acceptable, though not recommended).

Failed Actions

- **Minor Failures:** If an action minorly fails or slips but does not require the person to restart the entire sequence from scratch, the entire attempt can be merged into a single segment. (Splitting them into two separate segments is also acceptable).
- **Major Failures:** If an action fails so significantly that the person must completely restart the movement from the very beginning, the actions **cannot be merged**. They must be annotated as two separate action segments; merging them is an error.

2.6.2 Body Movements

Before the action: Preparatory actions (e.g., thumbs-up gesture, lowering the hand) should not be annotated.

Action onset: Start annotating the exact moment the formal action begins.

Post-Action Movements: Body movements after the formal action ends and prior to the thumbs-up are optional to annotate.

Supplementary Rule (Added on July 10)

1. **Must annotate:**

Body movements, such as sitting down, kneeling down, squatting down, turning around, moving, and standing up, must be annotated **when they occur after the preparation action (thumbs-up gesture, arm raising gesture) has been fully completed.**

2. Must not annotate:

Body movements, such as **sitting down, kneeling down, squatting down, turning around, moving, and standing up**, must **not** be annotated if they start while the preparation action (thumbs-up gesture) is still in progress.

3. Annotation is optional: (Updated on July 14: This type of action also should not be annotated)

When it is difficult to determine whether the preparation action (thumbs-up gesture) has already been completed or is still ongoing when the body movement begins, **you should not annotate this action.**

if it's not possible to clearly determine whether the preparatory action, such as give a thumbs-up or reach out, has ended, then body movements such as sit down or stand up should not be annotated. The key point is that preparatory actions must not appear in the annotation.

Turning

Turning refers to the rotation of the **entire torso/trunk**, not just turning the head or moving the arms.

If the turning angle is ≥ 80 degrees, annotation is **mandatory**; omitting it is an error.

If the angle is between **60 and 80 degrees**, annotation is **optional**.

If the angle is < 60 degrees, annotating it is an **error**.

- **Turning for body movement:** There is no need to describe the turn separately; it should be merged into the description of the movement action (though describing it is not considered an error).

Squat, Sit, and Kneel

If the video clearly distinguishes between "squat" and "sit down," use the exact corresponding term. If it is ambiguous, either "squat" or "sit down" will be accepted as correct.

Both single-knee and double-knee kneeling must be described as "kneel."

Visual criteria: If the knees clearly touch the floor/surface, it is a "kneel." If the knees clearly do not touch the surface, it is a "squat." If it is visually indistinguishable, either "squat" or "kneel" is accepted.

Kneeling and moving on a bed must be annotated if they meet the threshold conditions for kneeling and moving.

Example: The correct description here is: Kneel → Move next to the pillow → Pick up the pillow.

[\[file_v3_00102_5561ccf0-0695-4c6f-9c58-6b6feafe178g_67605aae-cbd8-464a-9949-1f3bc2931ee6.mp4\]](#)

Stand Up

Mandatory Annotation: The "stand up" action must only be annotated if it follows a crouch, sit, or kneel where there is a distinct change in the lower body/knees.

Distinct Change Definition: The angle between the thigh and shin is **less than or equal to 90°** ($\leq 90^\circ$).

Do Not Annotate: Do not label "stand up" if there is no change in the lower body

Ambiguous Cases: If it is impossible to determine whether the knees were bent during the action, either annotating it or leaving it unannotated will be marked as correct.

Bending Over

Bending over **must never be annotated** at any time; annotating it is an error.

Movement / Displacement

Annotation is **mandatory** if the person's position changes by ≥ 1.5 meters OR if the movement duration lasts ≥ 2 seconds (The 2-second duration is calculated from the moment the foot lifts to start moving until the foot plants at the destination) . Fulfilling either condition requires a "move" annotation; omitting it is an error.

- Minor displacements that do not meet these thresholds are optional.

Movement: Movement must include a destination (e.g., "Move to [location]"). Describing movement without a destination is an error.

- *Exception:* Turning for body movement. There is no need to describe the turn separately; it should be merged into the description of the movement action (though describing it is not considered an error).
- **Inherent Mobility Actions:** If an action inherently requires movement to be completed (e.g., pushing a shopping cart, mopping the floor, drawing curtains), it is already considered to describe movement. There is no need to use redundant phrasing like 'moving and pushing a shopping cart' or 'moving and mopping the floor.'

2.6.3 Subtle Actions

Annotating subtle actions secondary to the main activity is optional.

2.7 Nouns

- **Consistency:** Object names must remain consistent throughout the entire case (e.g., if a "glass bottle" is mentioned, it must remain a "glass bottle" in all subsequent descriptions and summary).
 - *Description Tips:* Remove unnecessary visual adjectives (color, shape, etc.) unless they are required to make the sentence sound natural (e.g., "Place the plate on another stack of plates" instead of "Place the plate on the plate").
 - **Tools:** Adding tool names is optional (e.g., "Wipe the table with a rag" and "Wipe the table" are both correct).

- **Precision:** Always use the most accurate and natural-sounding term. Describe objects at the smallest identifiable level (e.g., use "disinfectant bottle" or "cosmetic box" instead of just "bottle" or "box").
- **Multi-object Handling:** If more than 3 types of items are handled simultaneously, describe the 3 most prominent ones. For example: If the actual action involves picking up a clip, an eraser, a pen, a ruler, and a piece of paper, you only need to describe three of the most prominent items, such as 'pick up the clip, eraser, and pen from the table' or 'pick up the pen, ruler, and paper.' (This applies to action descriptions; in the summary, it is acceptable to refer to them generally as 'stationery items on the table.')

Nouns & Granularity Standards:

- **Annotation Principle:** Always prefer the most specific subcategory over a broad classification.
 - If a specific subcategory can be visually identified, but a broad parent category is used, it will be marked as an error.
 - Broad categories are allowed **only** when a more specific category cannot be visually determined.
- **Food:** e.g., rice, cake. If it is clearly a chocolate or lollipop, do not use "snack" or "food". Use the broad category only if the specific type cannot be determined.
 - **Vegetables:** e.g., cabbage, tomato, potato.
 - **Fruits:** e.g., apple, banana, grape.
 - **Beverages:** e.g., water, milk, juice.
 - **Grains:** e.g., wheat, corn.
 - **Furniture:** e.g., table, chair, bed, sofa.
 - **Tableware:** e.g., bowl, plate, chopsticks, spoon.
 - **Containers:** e.g., bottle, cup, bag, box. If it can be identified as a plastic bottle, beverage bottle, plastic bag, storage box, cosmetics box, etc., do not just describe "container."
 - **Appliances:** e.g., TV, refrigerator, washing machine, phone.
 - **Apparel:** e.g., jacket, pants, skirt, socks, clothes.
 - **Plants:** e.g., tree, flower, grass.
 - **Body:** e.g., head, hand, eyes, foot.
 - **Stationery:** e.g., pen, book, eraser, ruler.
 - **Toys:** e.g., building blocks, doll, ball.
 - **Materials:** e.g., wood, metal, plastic, glass. (Include the material description only when it is visually distinguishable.)

- **Food Ingredients:** e.g., meat, flour, sugar, salt.
- **Solids:** e.g., stone, brick, tile.
- **Liquids:** e.g., water, oil, alcohol.
- **Gases:** e.g., mist, smoke.
- **Tools:** e.g., hammer, screwdriver, scissors, pliers.
- **Cosmetics & Personal Care:** e.g., facial cleanser, face cream, lipstick, toothpaste, shampoo.
- **Musical Instruments:** e.g., guitar, piano, violin, drum.
- **Sports Equipment:** e.g., basketball, football, racket.
- **Jewelry & Accessories:** e.g., ring, necklace, earrings, bracelet.
- **Kitchenware & Cooking Tools:** e.g., pot, spatula, cutting board, whisk.
- **Bath & Cleaning Supplies:** e.g., towel, soap, mop, broom, brush.
- **Medical Equipment:** e.g., syringe, stethoscope, thermometer, bandage.
- **Office Equipment:** e.g., printer, stapler, paperclip, folder.
- **Packaging Materials:** e.g., foam box, bubble wrap, tape, cardboard box.
- **Parts & Accessories:** e.g., screw, nut, zipper, button, battery.
- **Laboratory Equipment:** e.g., test tube, beaker, microscope, graduated cylinder.
- **Decorations:** e.g., painting, sculpture, vase, candle.

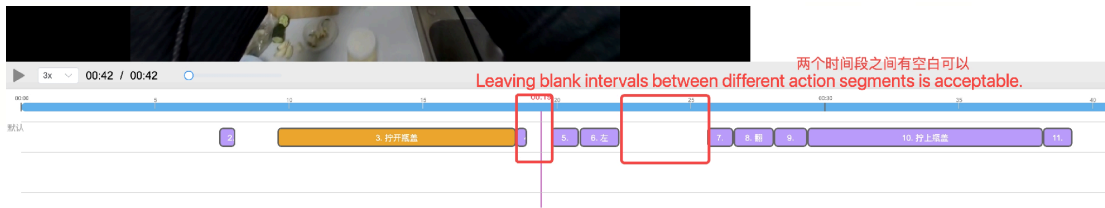

3. Standards for Correct Timestamps

General Boundary Rule: The start timestamp of an action segment must be the exact moment the hand makes contact with the object, and the end timestamp must be the exact moment the hand loses contact with the object.

Margin of Error: A tolerance of up to **0.5 seconds or 10 frames** is acceptable.

No Overlaps: Leaving blank intervals/gaps between different action segments is fine, but segments **must not overlap**. Overlapping segments will be marked as an error.

- The precise start is the moment the hand establishes clear contact with the object.
- Tolerances allow for up to 0.5 seconds before contact (hand has not touched the object yet) or up to 0.5 seconds after contact (hand has been touching the object for 0.5 seconds).
- *Critical Exception:* If the next action begins within that 0.5-second post-contact buffer, the end timestamp of the current segment must be cut off *right before the next action starts*, even if it falls within the 0.5-second tolerance. Failing to do so is an error.

Consecutive "Pick up" and "Put down" Actions: When performing "pick up" and "put down" actions on the same object with no other actions in between, the end timestamp of "pick up" **must match exactly** with the start timestamp of "place down". Any discrepancy will be marked as an error.

The end timestamp for any "put down" type action must be the exact moment the hand releases/leaves the object; otherwise, it is an error.

Focus on Human Action, Not Event Completion: Our tasks annotate human movements, not the physical completion of an external event.

- *Example (Closing a door):* If a person pushes a door closed, and their hand leaves the door while it is still in motion (before it hits the frame), the action's end timestamp must be the exact moment the hand loses contact with the door, *not* when the door completely closes.
- *Example (Throwing an object):* The action ends the exact moment the object leaves the person's hand, *not* when the thrown object lands on the ground.

Special Cases for Timestamps:

- **Pouring Actions:** The start timestamp can begin the exact moment the container starts tilting.
- **Strict Rule:** Preparation movements and "thumbs-up" gestures at the end of videos **must absolutely never** be included within the annotated action segments.

4. Standards for Correct Summary

Definition: Summarize what the person is doing in the entire video in 1 or 2 sentences. It **must contain the subject + the action summary + the result**. Both are mandatory; omitting either is an error.

The correct summary is not unique. As long as it covers the primary task and fully aligns with the video content, it is correct.

'Result' does not mean "the result of the action", it means the **purpose of the action**.

It refers to the intended goal after completing the action: why the person is doing it, not just the final step of the action itself.

For example, taking lettuce and bread is for making a sandwich, not merely putting the lettuce and bread together.

- *Note on exceptions:* Currently, due to inherent issues in certain tasks, some summaries can only capture the action but not the result. For now, descriptions that only include the action summary are accepted as correct *only if a result cannot be determined*. However, if a result is visible but omitted, it will be marked as an error.

- *Examples:*

- *Correct:* This person moves all the plates from the cabinet onto the table.

- *Correct:* This person unscrewed the bottle and then screwed it back on.

- *Incorrect:* Wipe the table with a cloth. -> *Should be:* This person wipes the table with a cloth to make the table clean. (*The description must include a clear subject: eg. "This person"*).

Collective Summaries: You can use collective terms for summaries, such as "stationery/kitchenware/snacks on the table." If an object is completely unidentifiable, you may use the generic term "object".

Summary Examples:

Video Case	Incorrect Summary	Correct Summary
[20260320115752.mp4]	• This person is doing some things in the kitchen. • This person presses the cloth with both hands, pushes the cloth in a circle around the sink, and wipes the entire countertop surrounding the sink.	• This person is wiping the countertop with a cloth to make the countertop clean. • This person uses a cloth to wipe back and forth to clear the countertop.

Appendix

Final Deliverables Format

1. **Format & Naming:** Files must be in JSON format and named using their original IDs (see example below).
2. **Delivery:** The final exported deliverables need to be uploaded to the Amazon S3 bucket, along with names or any other necessary information.
